

# Collections Analytics Executive Memo

## Decision

The reported sustained 11% month-on-month recovery improvement is not supported. March 2026 is +11.03% versus February, but April through July do not sustain an 11% improvement. January and July full-month recovery are effectively equal.

## What happened

Golden successful recovery is ■18.72 Cr in January and ■18.72 Cr in July. The complete-month series is volatile. August is incomplete and is excluded from the full-month claim.

## Data integrity

Successful payments contain 346 duplicate rows by payment\_id. Deduplication removes ■2.59 Cr. Event-level borrower IDs also conflict with the account master in approximately 98% of sampled event rows, so borrower-level attribution requires an explicit identity policy.

## Why

DPD mix standardization moves similarly to the raw recovery-per-target series, so DPD composition alone does not explain the pattern. Channel conversion is observational because channel assignment is not randomized. Campaign names are reused across strategy versions, so campaign-name-only trends are unsafe.

## Recommendation

Direct the ■10 Cr decision toward better borrower targeting, but release capital in stages through a stratified randomized holdout. Treatment and control should be balanced on DPD, risk, loan type, prior recovery and geography. Use 30-day recovery per eligible account as the primary outcome.

## Financial hurdle

The Jan-Jul full-month golden recovery annualizes to ■217.45 Cr. A ■10 Cr investment requires at least 4.60% incremental annual recovery to break even. The downside, base and upside scenarios are ■4.35 Cr, ■10.87 Cr and ■21.75 Cr of incremental recovery, with ROI of -56.5%, 8.7% and 117.5% respectively.

## Confidence

High confidence that the sustained 11% claim is unsupported. Medium confidence that DPD mix alone does not explain volatility. Low confidence in causal channel or targeting ROI until randomized evidence exists.
